

Proposed Tech Thesis/Capstone Template/Format 2025-2026

Thesis 1/Capstone 1	Focus
Chapter 1: Introduction A. Project Rationale a. Research Context i. Review of Related Literature ii. Research Methods and Findings b. Statement of the Problem B. Project Narrative a. Description and Objectives b. Scope and Limitations c. SWOT Analysis d. Project Testing and Evaluation i. Respondents ii. Instrument iii. Analysis (Thematic/Statistical) Chapter 2: Review of Related Works Chapter 3: Design Methodology A. Conceptual Framework B. Project Timeline C. System Scope / (For EMC) High Concept Game Design Document D. Requirements Specification / (For EMC) Prototype Overview Bibliography Appendices	• Determine the topic and focus of the thesis output/capstone project • Establish the problem/need and the context surrounding that problem or need through literature reviews and preliminary data gathering techniques (interview, survey, focus group discussion, observation, etc.) • Conceptualize the project that will address the problem • Determine the project objectives • Identify the project scope and limitations • Conduct SWOT (strength, weakness, opportunities, and threats) analysis on the project • Establish how the project will be evaluated based on established objectives • Review existing related technologies/systems/games/applications • Plan the design methodology
Thesis 2/Capstone 2	Focus
Chapter 3: Design Methodology (cont.) A. Conceptual Framework B. Project Timeline C. System Scope D. Requirements Specification Chapter 4: Results and Interpretations Chapter 5: Conclusions and Next Steps Bibliography (updated) Appendices (updated)	• Implement the full design methodology • Conduct prototype testing • Collect and report findings and feedback • Draw up conclusions and determine next steps to the project

CHAPTER 1: INTRODUCTION

This section of the paper highlights the preliminaries to the project development and implementation.

- A. **Project Rationale:** This section of the paper presents the justification for the project by highlighting preliminary research done on the chosen topic or area of interest and by zeroing in on the actual problem or issue to be addressed.
 - a. **Research Context:** This subsection provides the research context that would establish the existence of a problem or issue that can be addressed with technology. It will be made up of two subsections: Review of Related Literature and Research Methods and Findings.
 - i. **Review of Related Literature:** Students will cite from different information sources (news articles, web articles, studies, government documents, etc.) to give a clearer picture of the historical, social, and/or cultural context surrounding the topic or area of interest. The Review of Related Literature should ideally be written thematically to explore different aspects of the chosen topic.
 - ii. **Research Methods and Findings:** Students will discuss the preliminary data gathering methods done to supplement and deepen their understanding of the topic or area of interest further (e.g. interviews with experts, immersion, etc.) as well as to identify the role of technology in solving a problem, addressing an issue, bringing awareness, etc. Key findings will also be reported.
 - b. **Statement of the Problem:** This subsection brings attention to the problem, issue, or gap that can be addressed by the project. It should stem from insights obtained in the research context.
- B. **Project Narrative:** This section of the paper focuses on explaining what the proposed project is in light of the problem that had been identified.
 - a. *Description and Objectives:* This subsection provides a description of the proposed project and the specific objectives that the project intends to accomplish. It should be noted that the objectives should be aligned with addressing the **statement of the problem** and that the objectives will be the basis for how the project would be tested and evaluated.
 - b. *Scope and Limitations:* This subsection explains the extent by which the project would address the statement of the problem and accomplish the objectives.
 - c. *SWOT Analysis:* This subsection evaluates the project in terms of its strengths, weaknesses, opportunities, and threats. This is also the part where the students identify the project's overall marketability and/or unique selling proposition.

- d. *Project Testing and Evaluation*: This subsection explains how the project would be tested and evaluated. It should be noted that testing and evaluation is based on the project objectives.
 - i. *Respondents*: The respondents should come from the project's primary stakeholders (or target audience). Generally, at least thirty respondents are needed for testing and feedback on the prototype.
 - ii. *Instrument*: The type and content of the instrument should align with the project objectives. An instrument may be a survey questionnaire, a test, a checklist, etc.
 - iii. *Analysis*: Thematic analysis would be done for qualitative data obtained from methods such as interviews and focus group discussions. Statistical analysis would be applied to quantitative data obtained from closed-ended surveys and tests.

CHAPTER 2: REVIEW OF RELATED WORKS

This section of the paper focuses on the related works and technologies that either: (1) address the same or similar topic or issue as the present project; or (2) have features and functions that the proponents would want to include in the present project. Proponents are expected not just to read about related works and technologies but to actually gain hands-on experience with them if possible (e.g. playing the actual game and not just reading a review).

CHAPTER 3:

This section focuses on the actual development of the project.

CHAPTER 4: RESULTS AND INTERPRETATIONS

This section reports on results from the testing and evaluation phase of the project. This will also include interpretations of the data made by the proponents.

(For EMC) Includes the finalized Game Design Document.

CHAPTER 5: CONCLUSIONS AND NEXT STEPS

This section presents the proponents' assessment of the overall project, including key insights on the topic as well as on the uses, potentials, and limitations of technology. The section will end with the proponents identifying the next steps for their project based on the feedback given by users and the panel.

BIBLIOGRAPHY

This section contains an alphabetical listing of sources and works reviewed in the Review of Related Literature and the Review of Related Works.

APPENDICES

This section contains supporting documents for the project.
